## My Inventory

Inventory Management Software

# My Inventory

Many of our customers were saying, "Inventory Management software is so complex! I just need something simple to set up and use". We listened. We tested various designs of "My Inventory" with our customers.

The My Inventory software package is the result of the efforts of people with inventory management issues in many different companies. Once you have set up the software, most of the stock management occurs on one powerful screen. The tab-based software helps you buy and sell stock, create a database of your customers/suppliers, define inventory and consumable stock and provide reports and exports of your critical inventory data.

## The software has powerful features:

**Easy to Follow Instructions** are present on every page. There are step by step instructions to assist you with Stock Management, Selling of Stock, Receiving Stock, Importing Data and Exporting Data. There are also help buttons located near critical portions of the software.

**A Stock Quick Navigator** provides multiple views of your stock on one page (e.g. locations, categories, stock levels). Move Stock between Locations and Categories using a simple drag and drop.

**Manage Consumable Items** across your organization. Detailed reports show consumable stock movements, stock levels & locations.

**Powerful Import Capabilities** are available in the My Inventory software. Many organizations have information about their inventory available in their current software systems. Information such as stock IDs, descriptions, stock categories, locations, stock levels, cost and sell price, etc. This data can be loaded into the My Inventory software using Excel (csv) and text files.

**User Definable Data Fields** are available to create fields unique to your business. You can name up to eight data fields for your Items (e.g. sublocation, manufacturer, handling requirements).

**Print to a Dymo label printer** to create labels that display Stock Barcodes and Locations data using the cost effective Dymo LabelWriter Series of printers.

**Comprehensive Reporting** includes over 35 tailored reports detailing information about your Stock. Reporting categories include Stock and Item reports, Sales and Receiving reports, Stock History reports and Consumable Stock reports.

**Detailed Stock information** includes the ability to attach images to your stock descriptions.

**Export data into Excel** using our advanced export capabilities. The My Inventory software contains a set of preset imports such as Stock Descriptions, Stock History, Sales, Purchases, etc. You can also specify the exact data you wish to import and the order that you want the columns in.

**Many different types of barcode scanners** can be used with the My Inventory software. Corded barcode scanners can scan information directly into the software. Cordless (Bluetooth) barcode scanners let you "zap" barcodes back to the software. Portable barcode scanners and PDAs can collect data to import into the My Inventory software.

**Run your Inventory Management across different locations** within your organization. As long as you can connect to our central database you can manage your Stock across multiple locations.

**Receive in country support** for your software in Australia and the USA. Our team is ready to help you with any issues.
